

Figure 1. Left: elicitation rates across time bins of caregiver's vocal ($n = 690$) and non-vocal behaviors ($n = 65$). Infants responded to caregivers' vocal turns at the highest rate between 0-0.5s after caregivers' turn end, while infants responded to caregiver's non-vocal turns less and uniformly across time bins. *Right:* elicitation rates across time bins of caregiver's sensitive ($n = 272$) and redirective behaviors ($n = 45$). Infants responded to caregivers' sensitive turns at the highest rate between 0-0.5s after caregivers' turn end, while infants responded to caregiver's redirective turns less and uniformly across time bins. For both graphs, error bar is the standard error within each time bin.
